Core of Team Semantics

In most studied logics formulae are evaluated in a single state of affairs. E.g.,
- a first-order assignment in first-order logic,
- a propositional assignment in propositional logic,
- a possible world of a Kripke structure in modal logic.

In team semantics sets of states of affairs are considered. E.g.,
- a set of first-order assignments in first-order logic,
- a set of propositional assignments in propositional logic,
- a set of possible worlds of a Kripke structure in modal logic.

These sets of things are called teams.

Team Semantics: Motivation and History

Logical modelling of uncertainty, imperfect information, and different notions of dependence such as functional dependence and independence. Related to similar concepts in statistics, database theory etc.

Historical development:

- Branching quantifiers by Henkin 1959.
- Compositional semantics for independence-friendly logic by Hodges 1997. (Origin of team semantics.)
- Dependence logic by Väänänen 2007.
- Modal dependence logic by Väänänen 2008.
- Introduction of other dependency notions to team semantics such as inclusion, exclusion, and independence. Galliani, Grädel, Väänänen.
- Generalized atoms by Kuusisto (derived from generalised quantifiers).
Team Semantics: Motivation and History

Logical modelling of uncertainty, imperfect information, and different notions of dependence such as functional dependence and independence. Related to similar concepts in statistics, database theory etc.

Historical development:

- Branching quantifiers by Henkin 1959.

Propositional logic

Syntax of propositional logic:

\[ \varphi ::= p \mid \neg p \mid (\varphi \land \varphi) \mid (\varphi \lor \varphi) \]

Semantics via propositional assignments:

\[
\begin{array}{c|ccc}
"name" & p & q & r \\
\hline
s & 0 & 1 & 1 \\
\end{array}
\]

\[ s \models (q \land r) \]

Team semantics / semantics via sets of assignments:

\[
\begin{array}{c|ccc}
"name" & p & q & r \\
\hline
s & 0 & 1 & 1 \\
t & 1 & 1 & 0 \\
u & 0 & 1 & 0 \\
\end{array}
\]

\[ \{s, t, u\} \models q, \quad \{s, t\} \models (p \lor r) \]
Team semantics

We want that for each formula $\varphi$ of propositional logic and for each team $X$

$$X \models \varphi \quad \text{iff} \quad \forall s \in X : s \models \varphi.$$ 

We define that

- $X \models p \quad \text{iff} \quad \forall s \in X : s(p) = 1$
- $X \models \neg p \quad \text{iff} \quad \forall s \in X : s(p) = 0$
- $X \models \varphi \land \psi \quad \text{iff} \quad X \models \varphi \quad \text{and} \quad X \models \psi$
- $X \models \varphi \lor \psi \quad \text{iff} \quad Y \models \varphi \quad \text{and} \quad Z \models \psi,$

for some $Y, Z \subseteq X$ such that $Y \cup Z = X$. 
Team semantics

We want that for each formula $\varphi$ of propositional logic and for each team $X$

$$X \models \varphi \quad \text{iff} \quad \forall s \in X : s \models \varphi.$$ 

We define that

$$X \models p \quad \text{iff} \quad \forall s \in X : s(p) = 1$$
$$X \models \neg p \quad \text{iff} \quad \forall s \in X : s(p) = 0$$
$$X \models \varphi \land \psi \quad \text{iff} \quad X \models \varphi \text{ and } X \models \psi$$
$$X \models \varphi \lor \psi \quad \text{iff} \quad Y \models \varphi \text{ and } Z \models \psi,$$

for some $Y, Z \subseteq X$ such that $Y \cup Z = X$. 

Extensions of propositional logic

We extend PL by adding atomic formulae that describe properties of teams.

Dependence atoms: \( \text{dep}(p, q, r) \)
”the truth value of \( r \) is functionally determined by the truth values of \( p \) and \( q \)”.

\[
\begin{array}{c|ccc}
  & p & q & r \\
  s & 0 & 1 & 1 \\
  t & 1 & 1 & 0 \\
  u & 0 & 1 & 0 \\
\end{array}
\]

\[\{s, u\} \notmodels\text{dep}(p, r) , \quad \{s, t\} \models\text{dep}(p, q) , \]
\[\{s, t, u\} \models\text{dep}(q) , \quad \{s, t, u\} \models\text{dep}(r) \lor \text{dep}(r) .\]
Extensions of propositional logic

We extend PL by adding atomic formulae that describe properties of teams.

Inclusion atoms: $(p_1, p_2) \subseteq (q_1, q_2)$

"truth values that appear for $p_1, p_2$ also appear as truth values for $q_1, q_2$".

\[ \begin{array}{ccc}
p & q & r \\
s & 0 & 1 & 1 \\
t & 1 & 1 & 0 \\
u & 0 & 1 & 0 \\
{\{s, t\} \not\models p \subseteq q, \quad {\{s, t\} \models q \subseteq r, \quad {\{s, t, u\} \models (p, q) \subseteq (r, q)}} \\
\end{array} \]
Extensions of propositional logic

We extend PL by adding atomic formulae that describe properties of teams.

Syntax of propositional dependence logic PD:

\[ \varphi ::= p \mid \neg p \mid (\varphi \land \varphi) \mid (\varphi \lor \varphi) \mid \text{dep}(p_1, \ldots, p_n, q) \]

Syntax of propositional inclusion logic PLInc:

\[ \varphi ::= p \mid \neg p \mid (\varphi \land \varphi) \mid (\varphi \lor \varphi) \mid (p_1, \ldots, p_n) \subseteq (q_1, \ldots, q_n) \]

Syntax of propositional team logic PTL:

\[ \varphi ::= p \mid \neg p \mid (\varphi \land \varphi) \mid (\varphi \lor \varphi) \mid \sim \varphi, \]

with the semantics \( X \models \sim \varphi \) iff \( X \not\models \varphi \).
Important decision problems

Model checking:
Input: A team $X$ and a formula $\varphi$.
Output: Does $X \models \varphi$ hold?

Satisfiability:
Input: A formula $\varphi$.
Output: Does there exists a non-empty team $X$ s.t. $X \models \varphi$?

Validity:
Input: A formula $\varphi$.
Output: Does $X \models \varphi$ hold for every non-empty team $X$?

A well-known **NP**-complete problem: **3SAT**:

**Input:** A 3CNF-formula $\varphi$

(e.g., $(p_2 \lor \neg p_7) \land (\neg p_1 \lor p_3 \lor p_2) \land (p_3 \lor \neg p_4 \lor \neg p_2) \land p_2$).

**Output:** Does there exists an assignment $s$ s.t. $s \models \varphi$?
Source of hardness:

A well-known $\text{NP}$-complete problem: 

**3SAT:**

**Input:** A 3CNF-formula $\varphi$

(e.g., $(p_2 \lor \neg p_7) \land (\neg p_1 \lor p_3 \lor p_2) \land (p_3 \lor \neg p_4 \lor \neg p_2) \land p_2$).

**Output:** Does there exists an assignment $s$ s.t. $s \models \varphi$?

We may rewrite the above as follows:

**Input:** A existentially prenex quantified QPL-sentence $\varphi$

(e.g., $\exists p_1 \ldots \exists p_7((p_2 \lor \neg p_7) \land (\neg p_1 \lor p_3 \lor p_2) \land (p_3 \lor \neg p_4 \lor \neg p_2) \land p_2)$).

**Output:** Does $\emptyset \models \varphi$ hold?
Source of hardness:

A well-known $\textbf{NP}$-complete problem:

**EQBF:**

**Input:** A sentence $\varphi$ of the form $\exists p_1 \ldots \exists p_n \psi$, where $\psi \in \text{PL}$. 

**Output:** Does $\emptyset \models \varphi$ hold?
A well-known **NP**-complete problem:

**EQBF:**

**Input:** A sentence $\varphi$ of the form $\exists p_1 \ldots \exists p_n \psi$, where $\psi \in PL$.

**Output:** Does $\emptyset \models \varphi$ hold?

A well-known **PSPACE**-complete problem:

**QBF:**

**Input:** A sentence $\varphi$ of the form $\exists p_1 \forall p_2 \ldots \forall p_{n-1} \exists p_n \psi$, where $\psi \in PL$.

**Output:** Does $\emptyset \models \varphi$ hold?
From QBF to DQBF

A well-known \textbf{PSPACE}-complete problem:

\textbf{QBF}:
\textbf{Input}: A prenex quantified QPL-sentence $\varphi$ (e.g., $\exists p_1 \forall p_2 \forall p_3 \exists p_4 \psi$).
\textbf{Output}: Does $\emptyset \models \varphi$ hold?

The formula $\exists p_1 \forall p_2 \forall p_3 \exists p_4 \psi$ may be equivalently written with the help of Skolem functions $f_1 \in \{0, 1\}$ and $f_2 : \{0, 1\}^2 \rightarrow \{0, 1\}$:

$$\exists f_1 \exists f_2 \forall p_2 \forall p_3 \psi(f_1 / p_1, f_2(p_2, p_3) / p_4)$$
From QBF to DQBF

A well-known \textbf{PSPACE}-complete problem:

**QBF:**

\textbf{Input:} A prenex quantified QPL-sentence $\varphi$ (e.g., $\exists p_1 \forall p_2 \forall p_3 \exists p_4 \psi$).

\textbf{Output:} Does $\emptyset \models \varphi$ hold?

The formula $\exists p_1 \forall p_2 \forall p_3 \exists p_4 \psi$ may be equivalently written with the help of Skolem functions $f_1 \in \{0, 1\}$ and $f_2 : \{0, 1\}^2 \to \{0, 1\}$:

$$\exists f_1 \exists f_2 \forall p_2 \forall p_3 \psi(f_1/p_1, f_2(p_2, p_3)/p_4)$$

Formulae $\varphi$ of the form $\exists f_1 \ldots \exists f_n \forall p_1 \ldots \forall p_k \psi$, where $\psi \in \text{PL}$ and $\text{arg}(f_i) \subseteq \{p_1, \ldots, p_n\}$, are called as DQBF-sentences. Moreover, if $\text{arg}(f_i) \subseteq \text{arg}(f_{i+1})$ for all $i$, we say that $\varphi$ is simple.
A well-known **PSPACE**-complete problem:

QBF:
**Input:** A prenex quantified QPL-sentence $\varphi$ (e.g., $\exists p_1 \forall p_2 \forall p_3 \exists p_4 \psi$).
**Output:** Does $\emptyset \models \varphi$ hold?

The above **PSPACE**-complete problem can be reformulated as follows:

SDQBF:
**Input:** A simple DQBF-sentence $\varphi$.
**Output:** Does $\emptyset \models \varphi$ hold?
From QBF to DQBF

A well-known **PSPACE**-complete problem:

**QBF:**

**Input:** A prenex quantified QPL-sentence $\varphi$ (e.g., $\exists p_1 \forall p_2 \forall p_3 \exists p_4 \psi$).

**Output:** Does $\emptyset \vDash \varphi$ hold?

The above **PSPACE**-complete problem can be reformulated as follows:

**SDQBF:**

**Input:** A simple DQBF-sentence $\varphi$.

**Output:** Does $\emptyset \vDash \varphi$ hold?

Not so well-known **NEXPTIME**-complete problem:

**DQBF:** (Peterson, Reif, and Azhar 2001)

**Input:** A DQBF-sentence $\varphi$.

**Output:** Does $\emptyset \vDash \varphi$ hold?
From DQBF to ADQBF

Example: DQBF

Essentially an instance of DQBF is as follows:

$$\exists f_1 \ldots \exists f_n \forall p_1 \ldots \forall p_k \varphi(p_1, \ldots, p_n, f_1(\vec{c}_1), \ldots, f_n(\vec{c}_n)),$$

where $\varphi$ is a propositional formula and $\vec{c}_i$ is some tuple of variables from $p_1, \ldots, p_k$. 
From DQBF to ADQBF

Example: DQBF

Essentially an instance of DQBF is as follows:

$$\exists f_1 \ldots \exists f_n \forall p_1 \ldots \forall p_k \varphi(p_1, \ldots, p_n, f_1(\vec{c}_1), \ldots, f_n(\vec{c}_n)),$$

where $\varphi$ is a propositional formula and $\vec{c}_i$ is some tuple of variables from $p_1, \ldots, p_k$.

Definition

A $\Sigma_k$-alternating qBf, $\Sigma_k$-ADQBF is a formula of the form

$$(\exists f_1^1 \ldots \exists f_{j_1}^1)(\forall f_1^2 \ldots \forall f_{j_2}^2) \ldots (\exists f_1^k \ldots \exists f_{j_k}^k)\forall p_1 \ldots \forall p_n \varphi(p_1, \ldots, f_i^i(\vec{c}_i^i), \ldots),$$

where $\varphi$ is a propositional formula and $\vec{c}_i^i$ is some tuple of variables from $p_1, \ldots, p_n$. 
From DQBF to ADQBF

Definition

A $\Sigma_k$-alternating qBf, $\Sigma_k$-ADQBF is a formula of the form

$$(\exists f_1^1 \ldots \exists f_{j_1}^1)(\forall f_1^2 \ldots \forall f_{j_2}^2) \ldots (\exists f_{j_k}^1 \ldots \exists f_{j_k}^k)\forall p_1 \ldots \forall p_n \varphi(p_1, \ldots, f_j^i(\vec{c}_j^i), \ldots),$$

where $\varphi$ is a propositional formula and $\vec{c}_j^i$ is some tuple of variables from $p_1, \ldots, p_n$.

- $\Sigma_k$-ADQBF is $\Sigma_k^{\text{EXP}}$-complete odd $k$, and $\Sigma_{k-1}^{\text{EXP}}$-complete for even $k$.
- $\Pi_k$-ADQBF is $\Pi_k^{\text{EXP}}$-complete even $k$, and $\Pi_{k-1}^{\text{EXP}}$-complete for odd $k$.
- ADQBF is $\text{AEXPTIME(poly)}$-complete.
Connection between ADQBF and PTL

A $\Sigma_k$-ADQBF is a sentence

$$(\exists f^1_1 \ldots \exists f^j_{j_1})(\forall f^2_1 \ldots \forall f^j_{j_2}) \ldots (\exists f^k_1 \ldots \exists f^j_{j_k}) \forall p_1 \ldots \forall p_n \varphi(p_1, \ldots, f^i_j(c^i_j), \ldots)$$

can be written as the following $QPL[\sim, \text{dep}()]$-sentence
Connection between ADQBF and PTL

A $\Sigma_k$-ADQBF is a sentence

$$(\exists f^1_1 \ldots \exists f^1_{j_1})(\forall f^2_1 \ldots \forall f^2_{j_2}) \ldots (\exists f^k_1 \ldots \exists f^k_{j_k}) \forall p_1 \ldots \forall p_n \varphi(p_1, \ldots, f^i_j(c^i_j), \ldots)$$

can be written as the following $QPL[\sim, \text{dep}(\cdot)]$-sentence

$$\forall p_1 \ldots \forall p_n (\exists q^1_1 \ldots \exists q^1_{j_1}) (Uq^2_1 \ldots Uq^2_{j_2}) (\exists q^3_1 \ldots \exists q^3_{j_3}) \ldots (\exists q^k_1 \ldots \exists q^k_{j_k})$$

$$\sim \left[ \sim(p \land \neg p) \land \bigwedge_{1 \leq i \leq k} \text{dep}(\overline{c}^i, q^i) \right] \lor \left[ \bigwedge_{1 \leq i \leq k} \text{dep}(\overline{c}^i, q^i) \right] \land \theta$$
Connection between ADQBF and PTL

\[ \forall p_1 \cdots \forall p_n (\exists q_1^1 \cdots \exists q_{j_1}^1) (\bigcup Uq_1^2 \cdots Uq_{j_2}^2) (\exists q_1^3 \cdots \exists q_{j_3}^3) \cdots (\exists q_1^k \cdots \exists q_{j_k}^k) \]

\[ \sim \left[ \sim (p \land \neg p) \land \bigwedge_{1 \leq i \leq k} \text{dep}(c_i, q_i) \right] \lor \left[ \bigwedge_{1 \leq i \leq k} \text{dep}(c_i, q_i) \right] \land \theta \]

Dependence atoms can be eliminated from above by the use of \( \sim \).

The quantifiers can be eliminated by a shift to satisfiability and by simulating existential quantifiers by \( \lor \) and universal quantifiers by \( \sim \lor \sim \).
THANKS!
